SiteWhy

Data center moratoria and the site-selection bottleneck

321	**Moratoria or restrictions** Sep 2026, Electric Choice
32	**States with limits** Sep 2026, Electric Choice
NY Executive Order 62	**Statewide moratorium** Jul 2026

Table 1. Moratorium counts, Electric Choice, September 2026; New York Executive Order 62, July 2026

Site selectors and developers triage US greenfield sites before spending on legal review and interconnection queues.

Listing tools (Acres.com, Cherre DataCenter Intel, LightBox, Transect, C&W Athena) list rules and scores but do not reason about whether a rule applies to a site.

SiteWhy answers the harder question: which rules apply to this site at this MW, with the quote, the threshold math, and the flips that would change the verdict.

Source: README problem statement; judging evidence impact.md

Verdicts with the rule, the math and the flip

Figure 1. SiteWhy brand visual: site, grid and rule layers over the US | Source: branding/sitewhy-team.png

- **Verdict:** go, conditional or no-go for a US address plus IT load, with the verified rule text, the applicability math, and what would change the answer.
- **Track:** The Agent That Can Explain Why: every verdict traces to a quote plus arithmetic, never to a completion alone.
- **Scope:** federal Title V, a 1,291-entry moratorium dataset, Texas and ERCOT state and grid rules, verified county ordinances for Washington County MD and Pima County AZ.
- A screening tool, not legal advice.

Agent workflow from address to verdict

1

Plan

the planner drafts investigation tasks per layer on Nemotron Ultra · Input: address, MW, jurisdiction match · Output: per-layer tasks for federal, state and county investigators

2

Investigate

layer investigators gather candidate rules with quoted text · Lightning extraction; the county loop uses Markovian chunked reasoning · Output: candidate rules with quotes and source locators

3

Verify

deterministic quote check plus Lightning verify_support, retry at most twice · Unverifiable claims become needs_confirmation, never fatal verdicts · Output: verified, not_found or unsupported per claim

4

Decide

applicability in Python, draft verdict, critic re-investigates objections · Adjudicator and critic run on Nemotron Ultra · Output: verdict with the why-chain and the flips table

5

Trace

every message is a typed event in the shared World Model log; one run at a time with a 5-minute cooperative deadline · The log streams to the UI lanes with the model and receipt per request · Output: model_trace, markovian_runs and events in every sample

Technical stack

Layer	Choice
App	FastAPI and uvicorn; SAMPLE_MODE serves the recorded showcase reports
Data	Zetaris SITEWHY tables; DuckDB serves the same SQL when unreachable
AI provider	Meterless Nightshift for every model call, with a per-request receipt
Models	Nemotron Lightning 30B for extraction and verification; Nemotron Ultra 550B for planning and critique
Engines	World Model provenance log; Markovian county reasoning loop

Table 2. Stack as shipped, October 2026

- One run at a time; a run past its 5-minute deadline returns a partial needs_confirmation report instead of hanging.
- No local GPU needed; Python 3.12 with uv.

Source: README; app/llm.py STEP_MODELS; app/data.py

Zetaris and Meterless integration

Moratorium rows	Legislation rows	Traced model calls
1,291	440	30
Zetaris SITEWHY tables, Sep 2026	Zetaris SITEWHY tables, Sep 2026	model_trace across 5 samples

Table 3. Zetaris seed tables and recorded model usage, October 2026

- Nightshift is the primary AI provider; model and compute receipt per request appear in the UI agent lanes.
- World Model: a shared provenance-stamped rule graph with a per-run JSONL audit log.
- Markovian: bounded-context chunked county investigation, conformance-tested; current single-chunk sources save 0 tokens.
- Cursor: <to confirm>

Source: README sponsor tech; samples/*.json model_trace

Deterministic checks between model calls

Rule-listing tools	SiteWhy
List rules and scores for an area	Models propose candidate rules; Python decides applies yes or no
Leave the applicability question to the reader	Each claim carries the verbatim quote, source URL and as-of date
Keep no record of which model said what	Computed flips show what would change the verdict; the critic re-investigates

- Models propose, deterministic code disposes, so every verdict traces to a quote plus arithmetic.

Source: README; judging evidence why.md and tech.md

Evaluation and honest limits

Ground truth sites	Seeded critic faults	Recorded samples	Test suite
3 / 3	3 / 3	5	153 passed
Washington MD, Abilene TX, Tucson AZ	fatal-pima, title-v, washington-exemption	4 at 300 MW plus Abilene at 50 MW	pytest, 27 Oct 2026

Table 4. data/eval/results.json; samples/*.json; pytest run 2026-10-27

- Markovian saved 0 tokens on current sources; the engine and its accounting are implemented and tested.
- Seed rules are curated with runtime-verified quotes; autonomous rule discovery is roadmap.
- Coverage is modelled for Texas and ERCOT plus two counties; other states get a federal-only report with an explicit scope note.

Source: data/eval/results.json; README limitations

A no-go with its verified rule

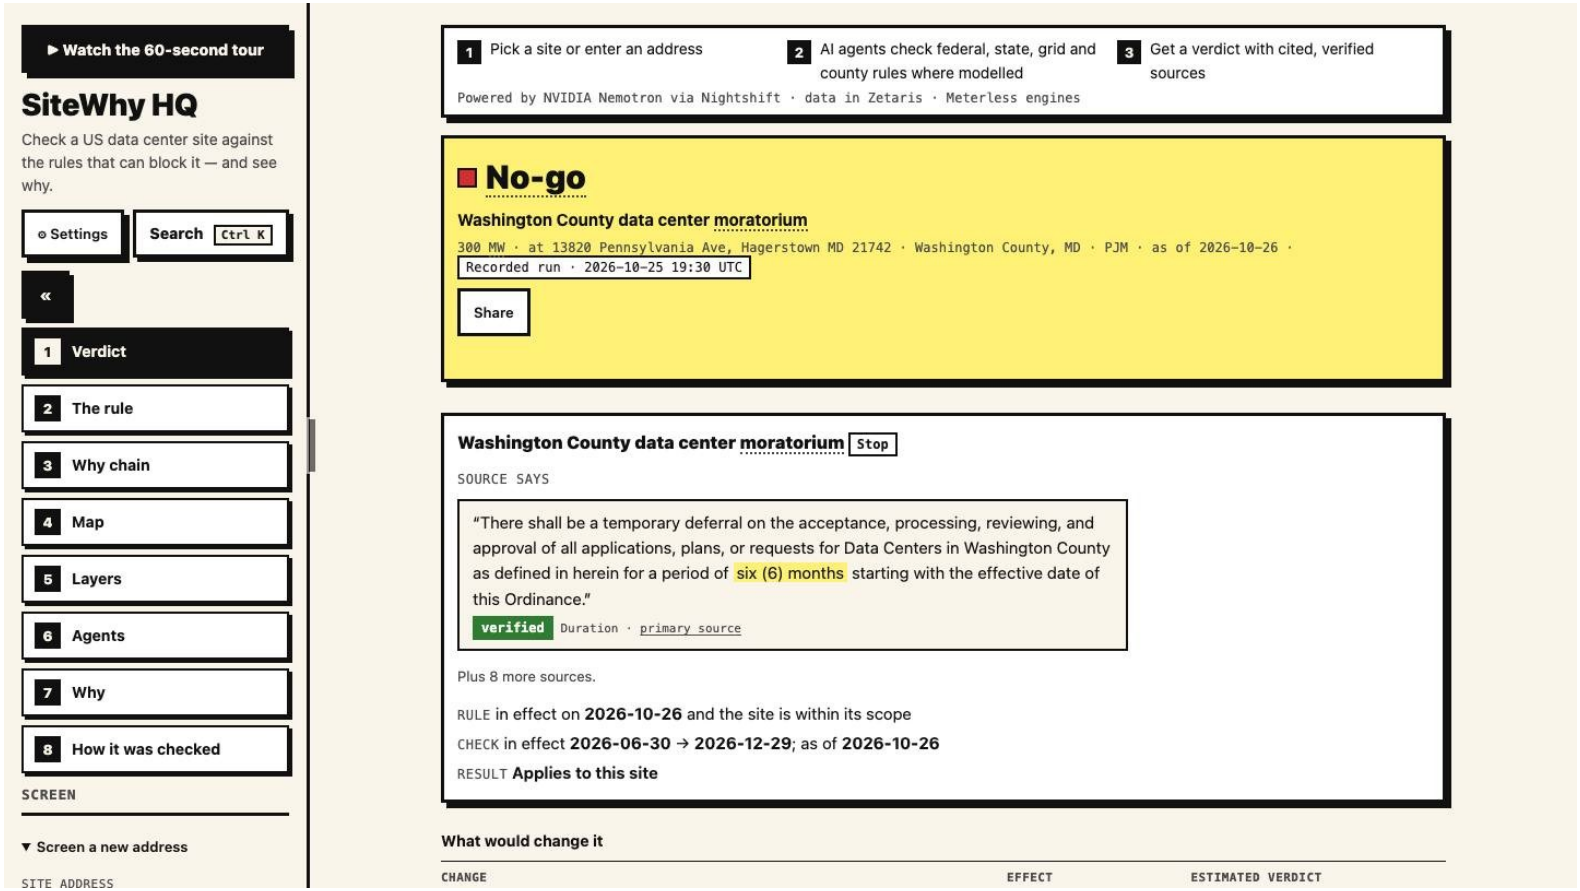

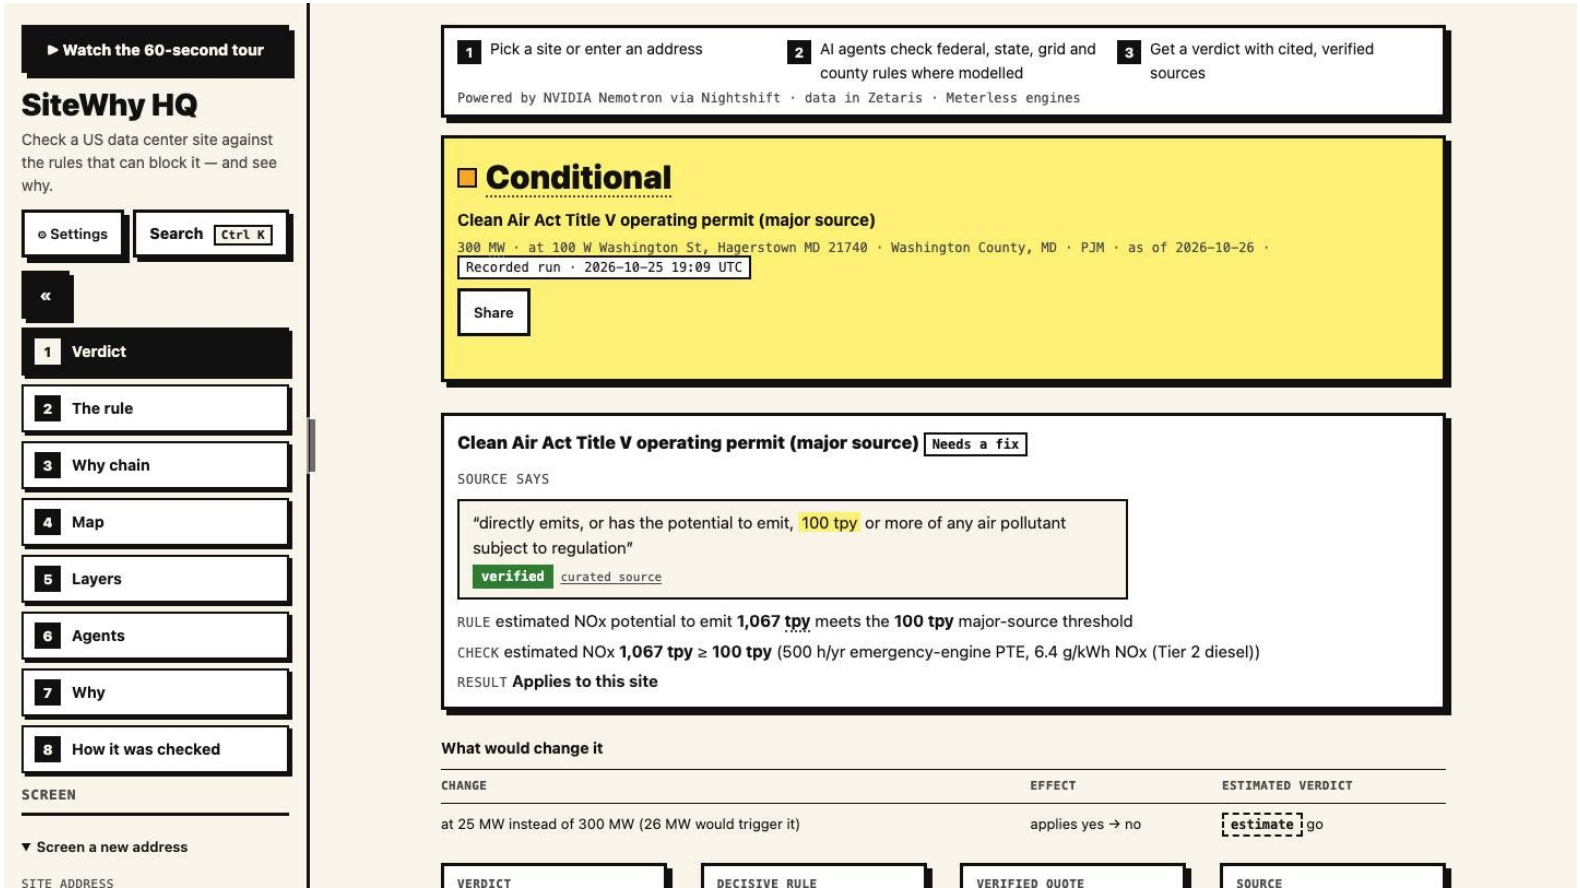

Figure 2. Recorded no-go report: county moratorium with verified quote and applicability math | Source: app screenshot, 27 Oct 2026, 1440×810

- **Finding:** Washington County MD unincorporated at 300 MW is no-go under county moratorium ORD-2026-12.
- **Evidence:** verbatim quote with a verified badge, duration and primary source, then the in-effect check and applies-to-site result.
- **Badge:** showcase reports carry a Recorded run mark with the UTC date; live runs carry none.

Source: samples/md-washington-county-unincorporated.json

Incorporated city versus unincorporated county

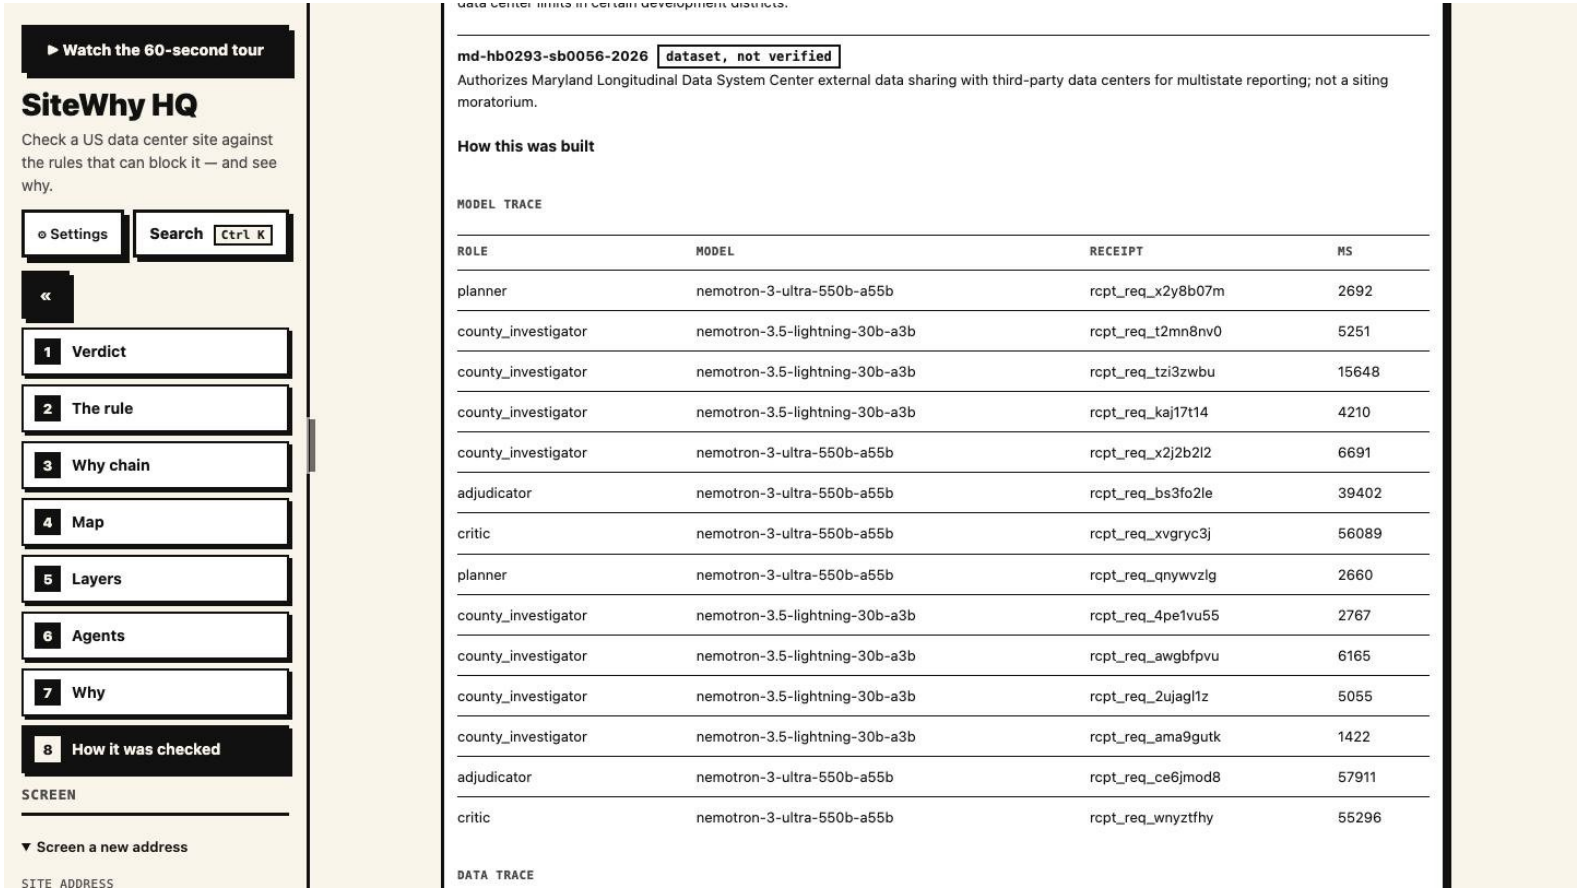

- **Flip:** the Hagerstown city site is conditional because the county ordinance does not cover the city.
- **Math:** the flips table shows that at 25 MW instead of 300 MW the Title V finding changes yes to no, with estimate badges on computed lines.
- The scope flip is the headline the demo leads with.

Figure 3. Recorded conditional report: the same county gives a different answer inside city limits | Source: app screenshot, 27 Oct 2026, 1440×810

Figure 4. Model trace: role, Nemotron model, compute receipt and latency per call | Source: app screenshot, 27 Oct 2026, 1440×810

- **Trace:** each row names the agent role, the Nemotron model, the compute receipt and the latency.
- **Roles:** Lightning handles extraction and verification; Ultra handles planning, synthesis and critique.
- 30 traced calls across 5 samples: 18 Ultra and 12 Lightning.

Source: samples/*.json model_trace; README evaluation

Recorded samples and verdicts

Sample	Input	Verdict
md-washington-county-unincorporated	13820 Pennsylvania Ave, Hagerstown MD 21742, 300 MW	no-go
md-hagerstown-city	100 W Washington St, Hagerstown MD 21740, 300 MW	conditional
tx-abilene-ercot	555 Walnut St, Abilene TX 79601, 300 MW	conditional
tx-abilene-ercot-50mw	Same Abilene address, 50 MW	conditional
az-tucson-pima	255 W Alameda St, Tucson AZ 85701, 300 MW	conditional

Table 5. samples/*.json, recorded 25 Oct 2026

- Four sites at 300 MW plus a 50 MW contrast at the same address; verdicts match the data/eval ground truth on the 3 checked sites.
- Each sample carries model_trace with the model per request, plus markovian_runs and events.

Source: samples/*.json

Planned enhancements and current scope

Enhancement	Why it matters
Agent rule discovery	Replace curated seed rules with runtime-verified discovery
More states and ISO rules	Extend beyond Texas and ERCOT plus two counties
Quote-to-value alignment check	Verify the numbers, not just quote presence
Multi-chunk Markovian demo	Show token savings on larger sources
Dockerfile judge path	One-command sample-mode run for judges

Table 6. Roadmap as of 27 Oct 2026; none of this changes the recorded verdicts above

- Current scope stays honest: no accuracy claims beyond the measured 3/3 ground truth and 3/3 seeded faults.
- Pre-window datasets and the Meterless specs are declared as pre-existing third-party material.
